

Terrain Analysis of Afghanistan -- Online

Terrain Analysis of Afghanistan – in English and now online – is an e-book, providing detailed local terrain analysis reports covering the entire area of the country, including border regions.

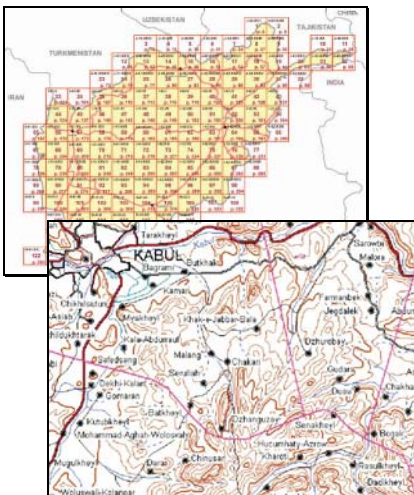

Each chapter corresponds to a geographic area described by individual Soviet/Russian topographic maps at 1:200,000 scale, with chapter names based on the largest population center for that area. The individual 200k map sheets contain thousands of geographic place names translated into English in accordance with the U.S. Board of Geographic Names standards.

Fingertip access to once-classified intelligence on:

- **Populated places:** from small towns and villages to major cities, local road conditions, building characteristics, water resources, housing density, sanitary conditions, telecommunications infrastructure, population levels.
- **Roads and bridges:** Load capacities, surface type (e.g. dirt, gravel, asphalt) and width, elevation, and seasonal conditions.
- **Topography and Soil Conditions:** Altitude and slope characteristics for mountainous areas, types of soils (e.g. sandy, clay), water tables, and seismic activity.
- **Hydrology:** Major rivers, widths, depths, and flow rates, banks/islands, silting, freezing pollution, and conditions affecting use.
- **Vegetation:** Grassy, forested shrubs, tree heights and types, predominant types of grasses, and crops cultivated.
- **Climate:** Temperature range by season, snow, rainfall, and wind conditions.

These detailed surveys have never been previously published in English and provide a fresh, accurate description of the local terrain environment, representing an invaluable resource for companies, government agencies, NGOs, and other groups who are or will be involved in the reconstruction and humanitarian efforts.

Each chapter contains an overview and detailed maps.
